It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```

```
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with missequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em., EMBL; Sw., SWISSROT; Tr., TREMEL; Wp.; WORMPEP; Information on the WORMPEP database can be found at hother. Wormper Repeat names beginning 'Dr.' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'dr.' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'dr.' were identified by the Recon repeat discovery system (ZHI-Let information see http://www.brojects/D_rerio/fishmask.shtml Lorel: Lorel: is from a CHORI-211 BAC library

/ggccattatggco; pouble-stranded cDNA was prepared from cell line RNA. 5 and 3 adaptors were used in cloning as follows: 5 adaptor sequence: 5 -CACGGCCATATGGCC-3 and 3 adaptor sequence: 5 -CACGGCCATATGGCC-3 and 5 -ATTCTAGAGGCCAGGCGCGACATG-dT(30)BN-3 (where B = A, C, of G and N = A, C, G, or T). Average insert size 1.65 kb (range 0.9-4.0 kb). 14/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SerLeuSerSerAsnAspAspGlyTyrGluAsnIleAspSerLeuThrArgLysValArg 100

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                    US-10-005-907-2

WPI; 2003-371981/35 P-PSDB; ADC31731 New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer.

SEQ ID NO 842; 1185pp; English. Claim 1;

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC31089) and the polypeptides they encode (ADC30800-ADC3106). The invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an enthod of detecting polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or and/or polypeptides of the invention. The invention methods for the identification of compounds that modulate the invention, methods for the identification of compounds that modulate the invention, methods for the identification of compounds that modulate the couring sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, and polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded by the contigs (ADC32627) and the polypeptides encoded for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases and cuttoff markers, and as food supplements. The present sequence represents a specifically and as food supplements. The present sequence of the ftp.wipo.int/pub/published_pct_sequences.

The invention relates to isolated nucleic acid (ABN81319-ABN81324), corresponding to genes differentially expressed in mast cells following activation or in patients with allergic hypersensitivity disease, [1] that encodes proteins (ABB77569-ABR77575) [11] or a protein fragment of [11] if at least 6 amino acids. [11] is useful for identifying binding partners. [1] or [11] is useful for identifying binding partners. (1) or [11] is useful for diagnosing or treating a disease state (e.g. allergic hypersensitivity, seasonal rhinitis, asthma, urticaria or atopic dermatitis or mastocytosis) in a subject which involves determining the level of expression of [1] or [11]. A computer system, comprising a database containing information identifying the expression level in a tissue or at least one mast cell of [1], is useful for passenting information to identify the relative expression level of containing information and allergic response in a patient. The protein can also serve as a target that modulate gene expression or activity and as an antigen to raise 120 485 545 Human, mast cell; MC; antiallergic; antinflammatory; antiasthmatic; vasotropic; dermatological; allergy; hypersensitivity; rhinitis; asthma; Novel isolated nucleic acids that are differentially expressed in mast cells in patients with allergic hypersensitivity, encoding proteins associated with mast cell regranulation and allergic hypersensitivity.                         agents that modulate expression of the protein or agents, such as agonists or antagonists. The agonists or antagonists are useful for modulating biological activity and function of (II) and thus are useful for alleviating disease conditions such as allergic hypersensitivity, seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis

ACC59924 to ACC59958 encode the human immune response associated proteins canti-HV, antialieragic, antianimal and than an immune response associated proteins canti-HV, antialieragic, antianimal antianaemic, antiparkinsonian, nootropic, anticanvulsant, antianteraics-cordic, antiaschmatic, antiparkinsonian, antianteraic, neprotropic, thyrominentic, neuroprotective, osceopathic, antiabetic, nepricorropic, thyrominentic, neuroprotective, osceopathic, antiatrhritic, antiparastici, antihelminthic, antipasoriatic, uropathic, ophthalmological, antirheumatic, haemostatic, antibacterial, uropathic, ophthalmological, antirheumatic, haemostatic, antibacterial, virucide, protocoacide and fungatice activities, and can be used in gene therapy. Human IRAP polymucleotides, agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of IRAP, such as immune system disorders (e.g. Achime, gout, diabetes mellitus, glomerulonephritis, Good pasture's syndrome, gout, drawes' disease, Hashimoto's thyroiditis, conteoporosis, panchame, gout, cancel disorders (e.g. ranal tubular assistics) and multiple sclerosis, osteoarthritis, Sjogren's syndrome, uveitis, and epilepsy), developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation), muscle disorders (e.g. arteriosclerosis, contental retardation), muscle disorders (e.g. arteriosclerosis, contental retardation), muscle disorders (e.g. arteriosclerosis, contental retardation), muscle disorders (e.g. arteriosclerosis, charactolyosetias, polycythaemia vera, perivaysmal nocturnal charactoric, and anticontental disorders (e.g. arteriosclerosis, charactolyosetias, polycythaemia vera, paroxysmal nocturnal charactoric, and anticontental disorders (e.g. arteriosclerosis, charactolyosetias, orthography, paroxysmal nocturnal fundal disorders (e.g. arteriosclerosis, charactolyosetias), or viral, bacterial, fungal, parastitic, contental disorders (e.g. arteriosclerosis, charactolyosetias), or viral, bacterial, fungal, p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human immune response associated proteins and polynucleotides, useful for diagnosing, treating or preventing immune system disorders, e.g. AIDS or anemia, cell proliferative disorders, e.g. cancer, or neurological

The invention comprises the amino acid and coding sequences of human screenory (SPTM) proteins. The SPTM DNA and amino acid sequences are useful for tracting a disease or condition associated with the expression of functional SPTM. The SPTM DNA sequences are useful for somatic or germline gene therapy to correct a genetic deficiency (e.g. severe combined immunodeficiency). The SPTM DNA sequences are also useful in parasites and protection against intracellular parasites (e.g. fungal parasites and protozoan parasites). The SPTM DNA and protein sequences are also useful for diagnosing cell proliferative disorders, cancer, immune disorders (e.g. AIDS), neurological disorders (e.g. multiple sclerosis), meningitis, abscesses, prion diseases (e.g. multiple sclerosis), meningitis, abscesses, prion diseases, cerebral palsy, neurological disorders, pertipheral nervous system disorders, and mental disorders (e.g. Tourette's syndrome). CDNA sequences ABL99746 - ABL99929 represent human secretory polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymucleotide sequences encoding human secretory proteins useful for gene therapy of e.g. genetic deficiency disorders, cancers, and diseases caused by intracellular parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Stuart J, Lincoln SE, Altus CM, Dufour GE, Chalup MS, Hillman JL; Jones AL, Yu JY, Wright RJ, Gietzen D, Liu TF, Yap PE, Dahl CR; Momlyama MG, Bradley DL, Rohatej SD, Harris B, Roseberry AM; Gerstin EH, Peralta CH, David MH, Panzer SR, Flores V, Daffo A; Marwaha R, Chen AJ, Chang SC, Au AP, Inman RR;

```

The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, medical imaging, identification of mutations

Claim 1, SEQ ID NO 123; 235pp; English.

disorders, and infections.

New isolated polypeptides and polynucleotides, useful for preventing, treating or ameliorating medical conditions, such as cancer, neurodegenerative disorders, lymphoid cell disorders, bone degenerative

responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or amellorating medical conditions, such as cancer, neurodegenzative disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell disorders, osteoporosis, osteoarthritis, bone desenerative disorders, periodontal disease, liver fibrosis, infections (e.g. viral, fungal or bacterial) or autoimmune diseases (e.g. diabetes, atopic dermatitis). Sequences ABX04986-ABX05511 represent human polymucleotides of the invention. Note: The sequence data for this patent is not represented in the Buxopean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             88

This sequence represents a nucleic acid molecule which encodes a secreted detailed in the descriptor line. The gene can be used too generate fusion proteins the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Rc portion (e.g. AAZ24802) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 95 novel genes and their fragments (nucleic acid sequences: AAZ24811-Z24907, amino acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 95 polynucleotides, based on which tissues they are most highly expressed in (see AAZ24811 for described uses)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CRS disorders, or neurodegenerative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, antibodies or antibody fragments that bind to the polypeptides, nucleic acids encoding the polypeptides, agonists or antagonists that binds to the polypeptide, are useful in preparing diagnostic or pharmaceutical compositions for diagnosing, treating or preventing an e.g. immune

c disorders, inflammatory conditions (e.g. inflammatory bowel disease, nephratitis or Crohn's disease), respiratory disorders (e.g. authma and allergy), cancers (e.g. gastric, ovarian or lung cancer), CNS disorders (e.g. multiple sclerosis or ischaemic brain injury), neurodegenerative c disorders (e.g. parkinson's disease). The disease, and cardiovascular disorders (e.g. atherosclerosis or uyocarditis). The polymucleotides are useful for chromosome identification, chromosome mapping, for controlling gene expression through triple helix formation or antisense DNA or RNA, in gene therapy, for identifying individuals con antisense DNA or RNA, in gene therapy, for identifying individuals con antisense DNA or RNA, in gene therapy, for identifying individuals condium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) gels, to raise antibodies, for testing biological activities, and for creating or preventing neural disorders, immune system disorders, censal, proliferative and/or cancerous diseases. This sequence corresponds to a gene encoding one of the polypeptide of the invention. Note: The cancer data for this patent did form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences.

The invention relates to novel genes ADA39629-ADA40565 and proteins ADA40566-ADA41501 for human secreted proteins, useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The polypeptides, nucleic acid molecules, antibodies or their fragments, and agonists or antagonists that bind to the polypeptide are disposed or preventing cancer or other hyperproliferative disposed. The polypeptides and nucleic adjanostic or pharmaceutical composition for disposing or treating cancer or other hyperproliferative disorders or other hyperproliferative disorders including neoplasms, autoimmune of sporders (e.g. diabetes, thematofa arthritis, systemic lupus or other hyperproliferative disorders including neoplasms, autoimmune disorders (e.g. diabetes, thematofa arthritis, systemic lupus erythematosus, multiple sclerosis, autoimmune thyroiditis or haemolytic anaemia), haematopoietic or hematological disorders (e.g. anaemia, thrombocytopenia), allergic reactions including asthma or eczema, thrombocytopenia), allergic reactions including asthma or eczema, thrombocytopenia), allergic reactions including asthma or eczema, thrombocytopenia, allergic reactions including asthma or eczema, thrombocytopenia, allergic reactions including asthma or eczema, thrombocytopenia, allergic reactions including asthma or eczema, thrombocytopenia, allergic reactions including multiple, or ordivaters (e.g. atherosclerosis, myocarditis), infectious diseases (bacterial, fungation or disposed or parkinson's disease), cardiovascular disorders (e.g. atherosche identification, radiation hybrid mapping or long-crange restriction mapping, as molecular weight markers, or as the setting and multiple and multiple probes. The polypeptides and antibodies are useful for providing immunological probes for differential identification or disposed in munohistochemistry assays. Note: The sequence data for other part direction in electronic format directly from NIPO at

The invention relates to a novel human secreted polypeptide comprising a defined sequence given in the specification. The polypeptide, nucleic acid molecule, antibody, agonist or antagonist of the invention may be useful for preparing a composition for diagnosing or treating a haemotolegic disorder such as anaemia, autoimmune disorders useful for preparing a composition for diagnosing or treating a haemotolegic disorder such as anaemia, autoimmune disorders useful arthritis, inflammation, Grave's disease, clabetes, systemic lupus erythematosus or glomerulonephritis, neurodegenerative disorders including Parkinson's disease and Alzheimer's disease, wounds and hyperpoliferative disorders including care therrosclerosis or cancer, as well as bacterial, viral, fungal or parasitic infections. The polypeptide may also be used during gene the polypeptide with a binding partner and determining whether the binding partner increases or decreases the activity of the polypeptide. The current sequence is that of the human secreted protein-related DNA of
New human secreted polypeptide for diagnosing, preventing or treating hematopoietic or hematologic disorders (e.g. anemia), autoimmune disorders (e.g. diabetes) or hyperproliferative disorders (e.g. cancer or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the protein. The polypeptides, nucleic acid molecules, antibodies or their fragments, and agonists or antagonists that bind are useful for preparing a diagnostic or antagonists that bind are useful for preparing a diagnostic or natagonists that bind are useful for treating allergic or asthmatic disorders. The polypeptide is also useful for identifying a binding partner by contacting the polypeptide with a binding partner, and determining whether the binding partner increases or decreases the activity of the polypeptide. The polypeptides and nucleic acid molecules are also useful for detecting, preventing, diagnosting, proposticating, reating or ameliorating inflammatory disorders neoplastic diseases, wound healing and disorders of epithelial cell proliferation, immune disorders, cardiovascular disorders, blood-related disorders, infectious diseases, endocrine disorders, or gastrointestinal disorders. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction probes. The polypeptides and antibodies are useful for providing immunohighted probes for differential identification or diagnostic immunohighted probes for differential identification of the tissues immunohighted.
                                                                                           human secreted protein; Antiallergic; Antiinflammatory; Antibacterial;

```
The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host call comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to parform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence
                                                                                                                                                                                                                New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
Costigan M;
                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page; 1017pp; English.

that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and (e.g. spinal segmental nerve injury (CMI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat DNA (shown in Table 2 of the sequence data for this patent did not form part of the printed secification, but was obtained in electronic form directly from WIPO at fib. Whypolished_pot_sequences.

                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a composition which comprises two antisense oligonuclectides. The first oligonuclectide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf, EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and c-yes. The second oligonuclectide is specific for a nuclear oncogene or proto-oncogene selected from myc, jun, c-ers, c-fcs, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin D1, PML/RAR alpha, AMLI/MTG9, EZA/prl and ALL-1/AF-4. The composition is used for treating cancer. The combination of antisense oligonuclectides has synergistically enhanced ability to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14 GluAsnGlnLysLysProLysLysGlyAsnProAspGluGluArgLysArgGlnGluMet 33

AAA09303-09 were isolated in a modified yeast two hybrid system using NIKI protein as "bait". These are known sequences which encode NIKI interacting proteins. The invention concerns purified complexes of a NIKI protein and a NIKI protein-interacting protein, where the interacting protein is chosen from TrkA, protein phosphatase lalpha, 14-3-3epsilon, alpha-tropomyosin, vimentin, p0071, Ini-1, IP-1, IP-2, IP-3, IP-4, or IP-5. NIKI (also referred to as Nak2) is a human homologue of the Aspergillus nidulans mitotic regulator, NIMA kinase. NIKI is a serinefthreonine-specific kinase and is thought to play a key role in call-cycle events leading to the onset of mitosis. The complexes, their derivatives and NIKI or NIKI-IP protein and DNA sequences, etc. are useful for treating or preventing a disease or disorder involving caberrant levels of the complex or protein. Such disorders include cancer, hyperproliferative disorders, neurodegenerative disorders cardiomyopathies, viral infections and metabolic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2301 BP; 545 A; 568 C; 785 G; 403 T; 0 U; 0 Other;

The invention useful in developmental biology and in alucidating cell signalling and cell-cell interactions in higher elevaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-AB130511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB27373-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions. --TyrThrVallleAsn 74 HislleProHisGlnArgSerSerLeuSerSerAsn---AspAspGlyTyrGluAsnIle 34 ThrThrPheGluArgLysLeuGlnAspGlnAspLysLysSerGlnGluValSerSerThr Drosophila; developmental biology; cell signalling; insecticide; Drosophila melanogaster genomic polynucleotide SEQ ID NO 33958. The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCK) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed carriers. (I) is useful in gene therapy techniques to restore normal activity of (II) are to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a crivity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and of its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abstrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in disqual for generating sequences have application of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. Asset197-Aas94564 represent novel human diagnostic codings sequences. Asset4197-Aas94564 represent novel human diagnostic coding sequences. Asset4197-Aas94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in the wind sequences.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
